

Non-Performant Algorithm

Quant:

Desk: Daniel Lee

Backtester:

Implementer:

Introduction:

This algorithm isn't meant to perform well since it is intended as a template for creating other algorithms.

Inputs:

- This algorithm takes in a dictionary where the keys are tickers for stocks
 - Values for the dictionary should be a key-value pair that represents the price and the trend metric (Up, down, empty string → nothing)

Backtesting:

Pending, but this algorithm will be terrible.
